

DELTA AMACURO MULTI-CLIENT 2D SURVEY

Greater Caribbean Basin
2D PreSDM seismic reprocessing

DUG in collaboration with Geox MCG

Project overview

2025 Broadband PreSDM reprocessed 2D seismic survey - 4,959 km.

The Delta Amacuro region has been significantly underexplored despite several field discoveries within the area.

The newly reprocessed data seeks to improve the understanding of the deposition and subsequent hydrocarbon potential of the region with numerous self-similar structures identified to the recently confirmed field FID's by various operators. The discoveries to date have been found in moderately deep water within shallow target zones, proving an encouraging likelihood to development.

Project highlights

More than 18,000 km of exclusive newly reprocessed (2025) datasets are now available for the Greater Caribbean Basin, covering key areas in Venezuela and Trinidad & Tobago. This project, undertaken by Geox MCG in partnership with DUG, provides advanced imaging of significant exploration potential in proximity to offshore oil and gas fields.

Goal: To improve subsurface imaging, reduce exploration risk, and identify new prospects in the Greater Caribbean region.

Application: The data is designed to assist in evaluating complex regional and stratigraphic relationships, including those associated with potential tie-backs to Atlantic LNG facilities.

Availability: These datasets are part of a larger campaign, with data available for viewing by request through Geox MCG.
